

Tutorial - 6

Ques 1) What do you mean by Minimum Spanning Tree what is the application of MST.

A minimum spanning tree or minimum weight spanning tree is a subset of the edges of a connected, edge-weighted undirected graph, all the vertices together, without any cycle and with the minimum possible total edge weight.

Application:-

- Designing local Area Network.
- Suppose you want to construct highways or railroad, spanning several cities, then we use the concept of MST to connect.
- To reduce cost, you use the concept of MST to connect the houses.

Ques 2) Please analyse the time and space complexity of Prim's, Kruskal, Dijkstra, and Bellman Ford algo.

Algorithm	Time complexity	Space complexity
Prim's	$O(V^2)$	$O(V+E)$
Kruskal	$O(E \log V)$	$O(\log(E))$
Dijkstra	$O(V+E)$	$O(V+E)$
Bellman	$O(VE)$	$O(V)$

Q. 3) Apply Prim and Kruskal algorithm on the graph to compute MST and its weight.

Ques 4 Given a weighted graph, you are also given the shortest path from a source vertex s to a given destination vertex, t . Does the shortest path remain same in the modified graph in which

Sol

(i) The shortest path may change. The reason is that no. of edges in different paths from s to t for example. Let shortest path of weight 15 and 5 edges. Let there be another path with 9 edges and total weight is 25. The weight of the shortest is increased by 5×10 , become $15 + 50$, weight of other path is increased by 9×10 , it becomes $25 + 90$. So the shortest path changes to the other path whose weight is 45.

(ii) If we multiply all edges weighted by 10, the shortest path doesn't change. The reason is simple weight of all paths from s to t .
